

GROWTH SYSTEM FIELD GUIDE

90-Day Growth Experiment Planner

A practical method for turning one commercial priority into a 13-week sequence of experiments, evidence, and decisions.

Use with	The editable Excel workbook included with this guide
Time required	60 minutes to plan, then 30 minutes each week
Outcome	One priority, a ranked backlog, 13 weekly decisions, and a reusable learning log

1. Start with the constraint, not the channel

A quarter is too short to chase every growth idea and long enough to learn something meaningful. Name one commercial priority in measurable language before you choose any activity.

- **Weak:** improve awareness.
- **Useful:** create 10 qualified conversations per month with Series A B2B AI founders.
- Record the baseline, the 90-day target, and the audience on the Start Here sheet.
- If the team cannot agree on one priority, that disagreement is the first decision to resolve.

2. Turn ideas into testable hypotheses

Every experiment should explain what you expect to change, for whom, and why. This prevents a tactic list from masquerading as a strategy.

Field	Question
Experiment	What specific intervention will the team make?
Hypothesis	If we change X, will audience Y do Z because of reason R?
Primary metric	Which observable behaviour will tell us something?
Decision rule	What threshold means keep, change, stop, or scale?

3. Use ICE to sequence, not to outsource judgement

Score Impact, Confidence, and Ease from 1–10. The workbook calculates the average. A high score earns attention; it does not make the decision for you.

- **Impact:** if it works, how much could it move the 90-day priority?
- **Confidence:** how strong is the evidence behind the hypothesis?
- **Ease:** how quickly and cheaply can the team get a useful signal?
- Run only as many experiments as the team can interpret. Two or three concurrent tests is usually enough.

4. Build the 13-week learning rhythm

Use the plan and weekly review sheets together. The point is not perfect scheduling; it is a fixed moment when evidence becomes a decision.

Moment	Purpose	Output
Monday read	Review the signal and risk	One priority for the week
Wednesday ship	Put the next useful test in market	Experiment live
Friday decide	Compare result with the threshold	Keep, change, stop, or scale

5. Make the decision log the compounding asset

The value of the quarter is the judgement the team can reuse. Record the decision, evidence, owner, next move, and any revisit date.

- A stopped experiment can be a good outcome if it invalidates a costly assumption.
- No decision is a warning sign: either the metric, threshold, sample, or ownership was unclear.
- At day 90, review the log before planning the next cycle. Carry learning forward, not just unfinished tasks.

A worked example

Priority: create 10 qualified founder conversations per month. Hypothesis: a specific founder point-of-view series will create replies because it names a problem the audience recognises but rarely sees articulated.

Experiment	Metric	Decision rule	Possible decision
3 founder POV posts	Qualified replies	Continue at 5+ replies	Change the angle after 2 posts with no qualified signal
Partner webinar	Qualified attendees	Repeat at 20+ registrants and 25% attendance	Stop if partner audience fit is weak
Lead-magnet nurture	Booked diagnoses	Scale at 3% within 21 days	Change message if clicks are healthy but bookings are not

Final check before you start

- One measurable commercial priority is written down.
- Each active experiment has an owner, metric, and decision rule.
- The Friday decision review is in the calendar for all 13 weeks.
- The team knows where decisions will be recorded.
- The founder is protecting the priority from new ideas until the next review.
